Research Experience

I currently work at the Center for Astrochemical Studies in the Max Planck Institut für Extraterrestrische Physik under the supervision of Dr. Paola Caselli and Dr. Jaime Pineda. My research focuses on the physical and chemical properties of the envelopes around Class 0/I young stellar objects. I investigate recently discovered asymmetrical gas inflows and how they affect the mass accretion process of embedded protostars. For this purpose, I use several molecular line observations coming from single-dish telescopes (like the IRAM 30m telescope) and interferometric arrays (for example, ALMA and NOEMA).

Until August 2020, I did my Masters at the Department of Astronomy in Universidad de Chile, supervised by Dr. Mónica Rubio. I analysed the physical properties of molecular clouds in low-metallicity environments, such as the Magellanic Clouds, mostly using carbon monoxide isotopologues emission and dust continuum emission in the far-infrared and submillimeter regime. I used recent observations from the Atacama Large Millimeter/Submillimeter Array (ALMA) and Atacama Pathfinder Explorer (APEX) telescopes, together with archival far-infrared data from the Herschel and Spitzer telescopes.
